Hydropower Alfalfa Blend- Seeding Year

Thank you for your business last year. I also know you have a choice of where to purchase seed. Thank you for choosing to purchase from MP Sales.

Why do I like blends for grasses, alfalfas, and clovers? For 2 reasons, they can work synergistically and spread the risk. The weather or your soil may favor one variety in the mix over another. For that reason, they are listed as first choice when picking brands or varieties.

Grazing Kingfisher Alfalfa/Grass as last cutting of the year

ALFALFAS

Alfalfa establishment: Seed bed preparation is important. **Do not cut corners.** Make sure the seed bed is smooth, clod free, and firm. At planting the soil should be firm enough for a footprint to sink no deeper than 3/8 inch. A pH reading near 6.8 is best. Do not try to establish alfalfa in low pH soils. Have adequate levels of phosphorus, potassium, calcium, sulfur, and boron. Manure can be a good source of all the nutrients needed.

FD=Fall Dormancy WS= Winter Survival (1 is best, 5 is worst) DRI= Disease Resistance Index

CTD = Coated

OC = Organic Coating

(not a complete list- other alfalfas available)

Variety or Brand Conventional	FD	WS	DRI	Comments
Kingfisher SynergyX Ignite  Ctd- 282.50 OC- 287.50	4.5	1.8	30-35/35	Combination of 4 elite alfalfa varieties with varied root systems. High yield potential with reduced crosslinking of lignin. CTD and OC
Kingfisher SynergyX Blaze  Ctd- 282.50 OC- 287.50	4.5	1.8	30-35/35	Combination of 2 elite alfalfa varieties with varied root systems. Focused on quality with high Ndfd and reduced rosslinking of lignin. CTD and OC
Kingfisher SynergyX Hydropower  Ctd- 282.50 OC- 287.50	4	2	30-35/35	Combination of 3 elite alfalfa varieties with a persistent red clover component. The choice if you want a clover component or for wetter areas. CTD and OC
Kingfisher SynergyX Fortress  Ctd- 282.50 OC- 287.50	4	2	30-35/35	Combination of high-traffic tolerant alfalfas including sunken crown, creeping, and branch root. Good choice for pasture and headlands. CTD and OC
Kingfisher 425HD OC- 287.50	4.5	2	30/35	Naturally bred for reduced lignin crosslinking which leads to higher fiber digestibility. OC

CLOVERS

Clover Establishment- The guidelines for establishing alfalfa can also apply for clover. Clover will tolerate wetter soils and more acidic soils a little better than alfalfa. Some growers will include 2-3# of Red Clover in with their alfalfa seeding, especially in wet, heavy soils. An older thinner stand of alfalfa can be thickened up by seeding 5-8# of a good red clover in the spring as soon as conditions allow. Clover may also tolerate grazing a little bit better.

(not a complete list- other varieties/brands available)

Variety or Brand		Comments	Conv	ORG
Multi-Year Medium Red for Hay or Pasture				
KF Red Power Blend	122.00	Blend of 2-3 Elite Clovers available 25#	X

White Dutch Clover	265.00	Low growing, traffic tolerant- used as living mulch 50#	X	X

Red Power Blend Clover interseeded into existing pasture.

GRASSES

Grass Establishment- A well prepared, firm seed bed is needed. ¼" to ½" seeding depth is preferred. As a companion with Alfalfa, use the latest maturing varieties available. Pay attention to the seeding rates on last page of this catalog. Italian ryegrass and Festuloliums will establish quickest, tall fescues, orchardgrasses, and perennial ryegrasses will show up more as the year goes on. Grasses need a steady supply of nitrogen for optimum yields.

Variety or Brand	Comments	Conv	ORG
Endophyte Free Tall Fescue			
KF Premium Hay Blend 68.00	Blend of at least 2 premium high yielding and high Ndfd tall fescues 25#	X

SUMMER FORAGES

Soil temperatures should be 60 degrees and rising at planting. 40-50# per acre, planting heavier will yield finer stems. Nitrogen and sulfur are important for maximum yield and quality. Manage for prussic acid and nitrate potential on the BMRs. Planting rates for Forage Sorghum will vary depending on whether it's drilled or planted in rows. No Prussic acid potential in Millets and Non-BMR Sorghums.

Consider adding cover crops as part of a system. To have something green and growing at all times is beneficial to the soil and environment. Winter grains can make excellent dairy feed when harvested at the right time.

COVER CROP IDEAS FOR SUMMER/LATE FALL

Going to corn following year- One of these mixes:

Seed down by Late August:

18-25# Nitrogreen Mix: mix of Hairy Vetch, Red, Crimson, Yellow Blossom, and Balansa Clovers
And Nitro Radish. Can provide N for corn and loosen soil.

18-25# Soil Builder Mix: mix of Annual Ryegrass, Hairy Vetch, Crimson Clover
and Nitro Radish. Can provide N for corn and loosen soil.

15-40# Terra-Life Maizepro: mix of legumes and summer annuals formulated specifically
to plant as cover before corn.

Custom Mix of any of the ingredients in the mixes above depending on purpose.

Mixes containing Legumes will provide a nitrogen credit for the corn. Of course, a later termination will allow for greater accumulation of legume biomass, thus providing more nitrogen. These crops will need to be terminated via herbicide or tillage. **It seems to work best if you can lightly till top planting zone.**

Going to Soybeans following year:

Seed down by Late August:

18-20# Terra-Life Rigol DT: mix that works as cover before soybeans

Seed down late fall:

50 to 150# Winter Rye: 50# minimum- heavier if planting green or rolling down.
Plant heavier if planting later

If needing Spring Forage:

100 to 150# of Winter Rye, Triticale, Wheat- (harvested in vegetative stage)

Plant wheat by late September.

Plant Triticale by early to mid-October.

Rye can be planted later- plant heavier if later and not less than 2 bu/acre

For best quality of Spring Forage, harvest at Flag Leaf Stage

If Rye is 2 feet tall and weather allows harvest, don't wait- take it for best quality.

Can plant soybeans following these crops after forage harvest.

Can plant a summer forage to double crop. (Forage Sorghum, or Sudan, Millet)

If needing Fall Forage:

100 to 150# Oats, Haymaker Barley, Spring Triticale for forage before hard frost

Can add forage peas to increase protein content

Plant by end of August- if planting early September, use Haymaker Barley

Can mix in a little forage brassica if planting in August

WINTER GRAINS:

PRICING AND AVAILABILITY DETERMINED LATE SUMMER, EARLY FALL

Special Truckload Pricing will be available on the following:

(terms: 880 bag minimum to one location, can mix product, also available in totes)

- Winter Triticale
- Cereal Rye
